COMICCRAFT

Brainstorming & Ideation Phase

AI Comic Story Creator – Project Phase Documentation

This document contains 10 pages covering the selected project phase.

1. Introduction

• ComicCraft is an AI-based comic story creation project. The main idea is to help users create a comic story from a simple topic or idea.

• The brainstorming stage focuses on identifying the problem, understanding the target users, collecting possible features, and selecting a practical project idea.

• The project aims to combine story generation, panel planning, narration, dialogue, image generation, and final comic presentation in one workflow.

2. Problem Identification

• Creating a comic manually requires time for writing, planning scenes, creating dialogues, designing characters, and preparing images.

• Students and beginners may have difficulty converting a simple idea into a complete multi-panel comic.

• ComicCraft addresses this problem by providing an assisted workflow in which the user supplies a topic and the system helps create structured comic content.

3. Initial Ideas

• During brainstorming, several possible features were considered: topic-based story generation, character creation, panel descriptions, narration, dialogue generation, image generation, preview, and PDF export.

• The ideas were compared according to usefulness, implementation difficulty, and suitability for an academic project.

• The selected concept was an AI comic story creator because it combines creativity with practical AI and web-development concepts.

4. Target Users

• The main target users are students, beginners, creative writers, teachers, and users who want to create simple visual stories.

• The interface should therefore be easy to understand and should not require advanced programming knowledge from the end user.

• Simple input and clear output are important requirements identified during ideation.

5. Feature Brainstorming

• Possible core features include topic input, automatic outline generation, story generation, panel-wise narration, character dialogue, comic-style image generation, preview, and export.

• Optional future features include character consistency, multiple art styles, multilingual stories, voice narration, user accounts, and cloud storage.

• The first version should focus on essential features so that the project remains manageable.

6. Technology Ideas

• Python was considered suitable for backend development because it supports AI integration and rapid application development.

• FastAPI can be used to expose backend routes and APIs.

• Image-processing libraries can support locally generated comic-style panels, while an AI/LLM service can be connected for advanced text generation when configured.

7. Workflow Idea

• The initial workflow is: user enters a topic → system creates an outline → story and dialogue are generated → panel images are produced → panels are displayed → final comic can be exported.

• This workflow gives the project a clear beginning, processing stage, and final output.

• The workflow was selected because it is easy to demonstrate and explain.

8. Feasibility Discussion

• The project is technically feasible because the required components can be implemented using common Python libraries and web APIs.

• An important consideration is API availability and configuration. If an external AI service is unavailable, a simplified local generation method can be used for demonstration.

• The project can be developed in stages, reducing implementation risk.

9. Selected Idea

• The selected project is ComicCraft – AI Comic Story Creator.

• The project focuses on converting a user topic into a structured comic consisting of multiple panels with story content and visuals.

• The selected idea provides a clear demonstration of generative AI concepts, backend development, file handling, and user interaction.

10. Ideation Conclusion

• The brainstorming phase established the purpose, users, features, workflow, and technical direction of ComicCraft.

• The next stage is requirement analysis, where the selected idea is converted into detailed functional and non-functional requirements.

• The ideation phase therefore provides the foundation for all later development activities.
