COMICCRAFT

Project Development Phase

AI Comic Story Creator – Project Phase Documentation

This document contains 10 pages covering the selected project phase.

1. Development Introduction

• Development converts the approved design into working software.

• ComicCraft can be implemented incrementally so each component can be tested before integration.

2. Environment Setup

• Install Python and create the project environment.

• Install the required packages and prepare the project folders.

• Configure environment variables if an AI API is used.

3. Backend Development

• FastAPI can be used to create the application backend.

• Routes receive user input, call generation functions, and return results.

4. Outline Generation

• The outline module creates a structured sequence of comic panels.

• A fixed panel count can be used for a simple academic demonstration.

5. Story Generation

• The story module expands panel outlines into narration and character dialogue.

• The output should remain connected to the selected topic.

6. Image Generation

• The image module creates or processes a visual representation for each panel.

• Generated images can be saved under a static panels directory.

7. Integration

• The modules are connected so that the output of outline generation feeds story generation and image generation.

• The complete workflow should be callable through the application route.

8. Export Development

• The application can create an export directory and save the final comic or supporting files.

• PDF export can be added as an optional project feature.

9. Error Handling

• try-except blocks and FastAPI HTTPException can handle API, JSON, input, and file-related failures.

• Error responses should be understandable to the user.

10. Development Conclusion

• The development phase produces the working ComicCraft application.

• After development, the integrated system is moved into systematic testing.
